

Abstract

The washer-extractor (41) having only a single front-end opening (13) of the drums (12, 14). This opening (13) is used for loading and also unloading. The openings (13, 15) can be closed by a door (46). The door (46) can be separated from the drums (12, 14). In addition, the door (46) does not co-rotate when the inner drum (12) is rotationally driven for washing and spinning the laundry. A washer-extractor (41) of this type is characterized by its simple design and by a reliable sealing effected by the door (46), particularly when the washer-extractor (41) is arranged in the dividing wall (43).
